

SDLC Model Selection for Online Shopping Website

1) Introduction

An online shopping website is used to buy products over the internet. It includes features like product listing, add to cart, payment, and order tracking.

In real life, these types of websites keep changing regularly because new features, offers, and updates are introduced. So, it is important to choose an SDLC model that can handle these changes easily.

2) Selected SDLC Model

Agile Model (Scrum)

3) Justification

First of all, the requirements of an online shopping website are not fixed. New things keep getting added like discount systems, UI changes, and new payment options. Agile model supports changes at any stage, which makes it suitable.

Secondly, user feedback is very important in such systems. If users face any difficulty, it should be improved quickly. In Agile, feedback is taken after every cycle, so improvements can be made faster.

Another reason is incremental development. The system is developed in parts such as login, product page, cart, and payment. This makes the work easier and more organized.

Also, testing is done in every iteration, so errors can be found early. This reduces the chances of major problems later, especially in important modules like payment.

Lastly, Agile is flexible and scalable. New features can be added without affecting the whole system, which is very useful for e-commerce websites.

4) Comparison with Other Models

Waterfall model is not suitable because it requires all requirements to be fixed at the beginning. In online shopping websites, this is not practical. Also, changes are difficult to make once development starts.

Spiral model is also not very suitable because it is complex and focuses more on risk analysis. It is generally used for large and high-risk projects, so it is not necessary for this type of system.

6) Conclusion

From the above discussion, Agile model is the most suitable for an online shopping website because it is flexible, supports continuous changes, and focuses on user feedback. It helps in developing a better and more practical system.
